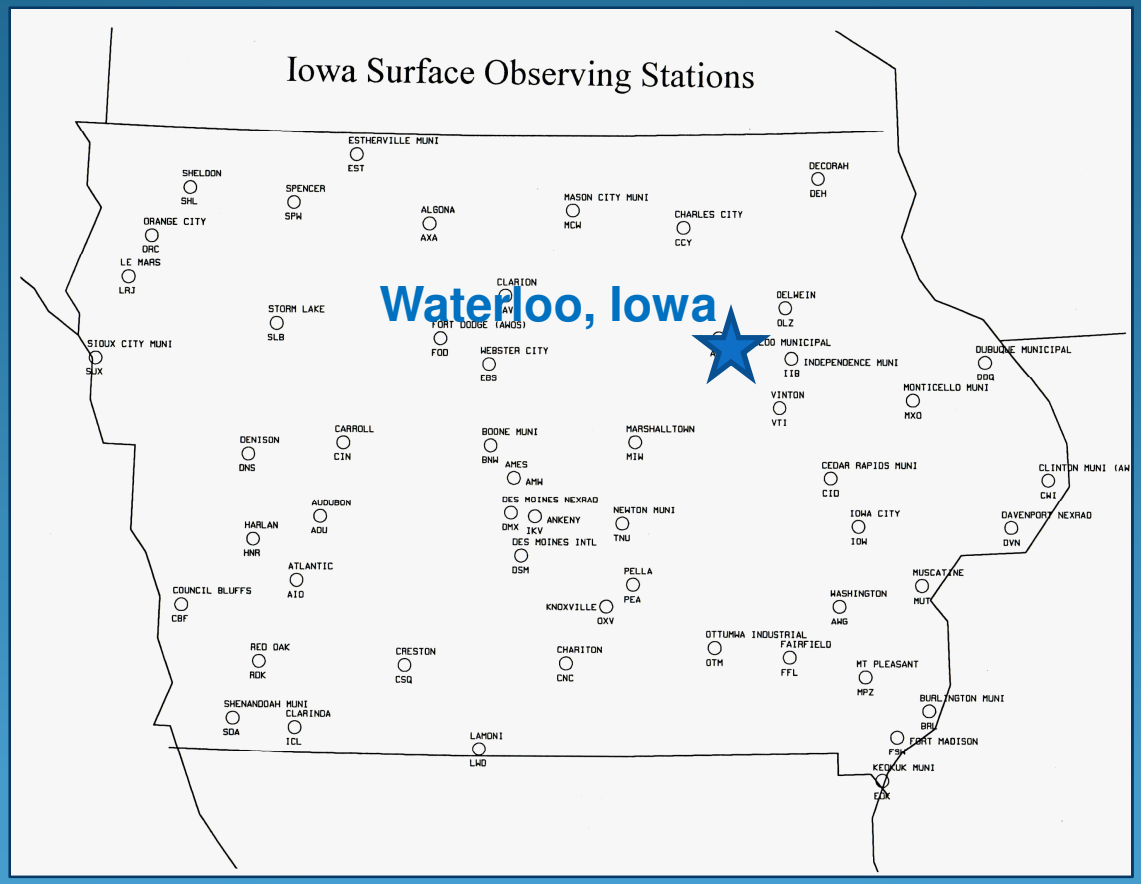
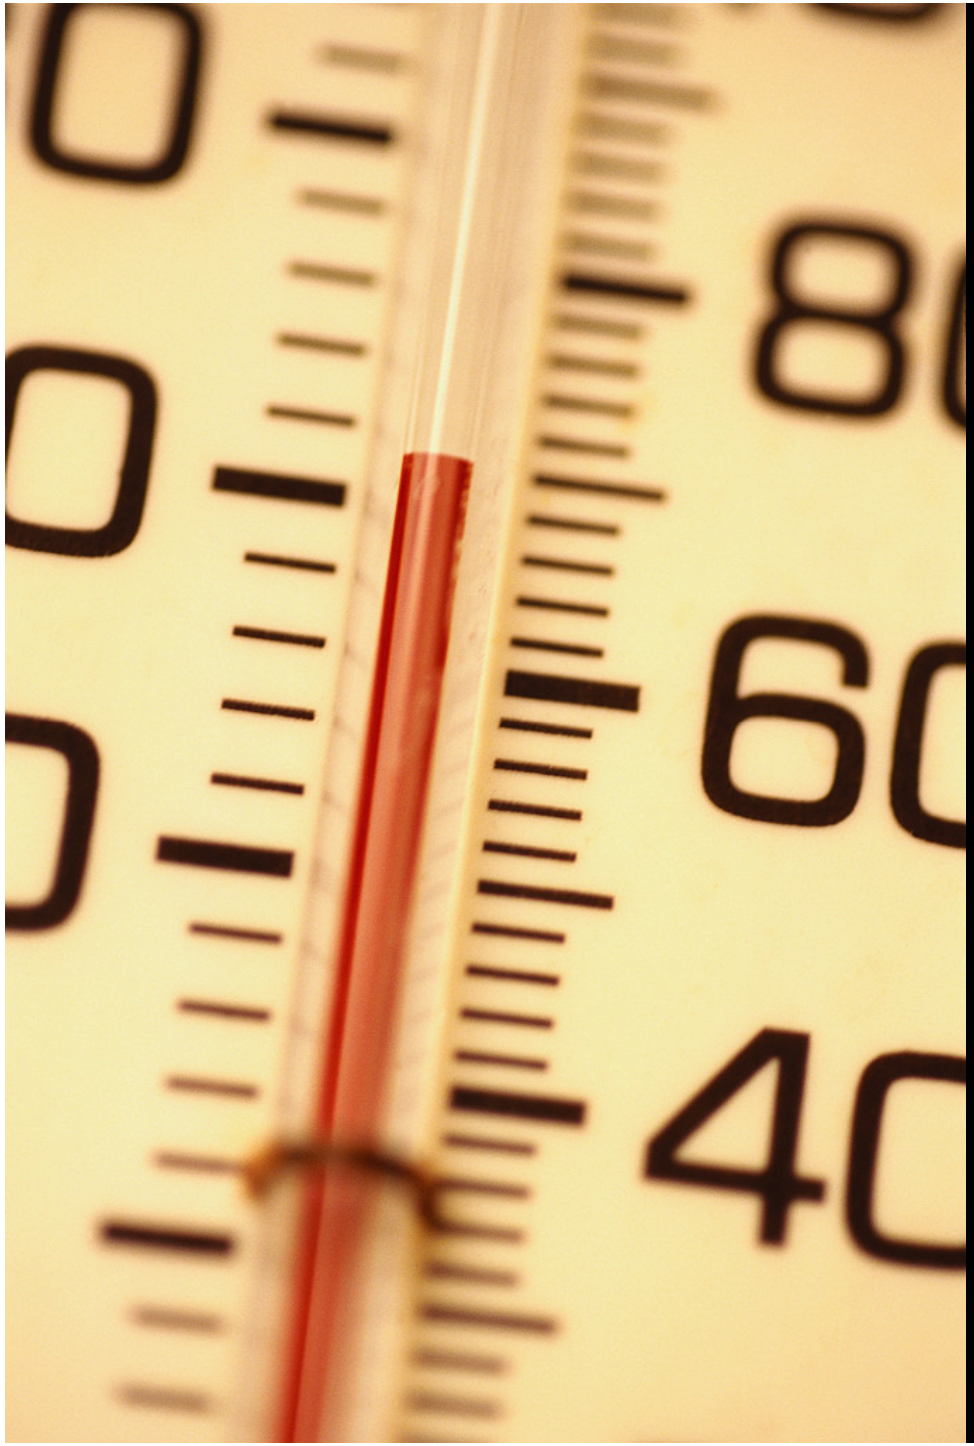
My Forecast



Low Forecast: 7 p.m. on June 30 – 7 a.m. on July 1

High Forecast: 7 a.m. – 7 p.m. on July 1



This forecast provided by

Joe Cool

My Low Forecast for

7 p.m. on June 30 – 7 a.m. on July 1

55°F

Evidence for Low Forecast:

I considered the average between climatology (61°F), persistence (58°F), and Perfect Prog (52°F). I leaned a couple of degrees cooler than the average of the three due to the cooler trend of the previous day.

My Low Forecast for

7 p.m. on June 30 – 7 a.m. on July 1

55°F

Actual Low = 59°F

Verification of & Reflection on Low Forecast:

Due to cloud cover, it remained warmer than I had anticipated. I had not considered the possibility or impact of cloud cover on the forecasted temperature.

My High Forecast for

7 a.m. on July 1 – 7 p.m. on July 1

72°F

Evidence for High Forecast:

I considered the average between climatology (85°F), persistence (67°F), and Perfect Prog (77°F). I leaned a few degrees cooler than the average of the three due to the considerably cooler trend of the previous day.

My High Forecast for

7 a.m. on July 1 – 7 p.m. on July 1

72°F

Reflections on High Forecast:

I would leave my forecast the same. I think the presence of cloud cover will cause it to remain cooler than the climatology average over the past 30 years and the perfect prog computerized projections. But I think we are entering a warming trend. So I predict it will be warmer than the previous day as indicated by the persistence records.
